G /236 cont./

*174 601 So, let us begin with the Amur peoples. In the Amur region we find two basic ethnic groups -- Paleo-Asiatics, and the Gilyak and the Tungus nationalities and in part the Ainu, joining them from the side of the Japanese archipelago.

We do not have to talk about the Gilyak -- they not only have the Turanian system in its most complete form, but in addition they have preserved the ideal form of the punalua family, the analysis of which has shown us that the Turanian system is the result of cousin marriage.

A 101 174 601 835 The Ainu tribe, to which, as the neighbors of the Gilyak, we shall devote a special chapter, is excluded from our survey as a tribe that is both racially and linguistically unique among the circle of peoples of northeast Asia. It is equally unique in its family structure. They have a classificatory system, but it differs in many essential respects from the Gilyak and the Tungus. Equally radically different from these latter are their marriage norms and their social organization. Among the Ainu, for instance, marriages are allowed both between the children of brothers and between the children of sisters, and in this respect they resemble more closely the northern Paleo-Asiatics -- the Yukagir and the Chukchee. The features of group marriage in the form of the mutual rights of brothers to each other's wives have been found by me at only a few points, and only the levirate fully coincides with the Gilyak-Tungus. The most important characteristic trait of the Ainu system, however, is the typically pronounced maternality and the absence of a clan structure -- a feature which also brings them closer to the northern Paleo-Asiatic group. In any case in /237/ view of the complete isolation of this tribe in all other respects from the group of nationalities in which we are interested, we note only their peculiarities, without engaging in any kind of comparison.
